"Data is not one size fits all, you need to think about what you want to do, and then go out and collect it." Sourced from: Medium.com: Optimization of World class PHP/MySQL website I'm an intermediate programmer on php and mysql. I need some advices about: 1 - The best way to build a world class PHP/MySQL website. 2 - I am using a MySQL database and I need to implement a lot of other stuff on it. Which way is the best? Database to store all the data (and use only one language for all of the stuff), or use only one language for database and everything else? 3 - I need some information about all the things that are around to use them. So I can choose the ones that I like. I hope you can help me with this. Thanks A: 1) Best is to use the framework that does the MVC for you. You can start small by going with a framework like Zend, but it would be good to have a working knowledge of basic MVC. Learning both Zend Framework and the MVC architecture will help you immensely. 2) In my experience, I have found that using a database for this level of application is much more maintainable than trying to build everything in the database as well as in code. MVC is a pattern that I often find useful. You should be able to do everything you want in the database using the ORM capabilities of Zend Framework. 3) I think this is a little more difficult to answer. What are the other things that you need to do? From an architecture standpoint, if you use a framework, you may need to use a database abstraction layer. What else would you like to know? What are the technologies that you are using? Best of luck! Experience the inside and outside of the tiny house that has been turned into a beautiful home. Year after year, design and home renovation ideas have grown as the industry itself has evolved. With the evolution of tiny houses and the increased availability of land and funding, a new market has opened up to customers. The new tiny house market has expanded beyond the camper van look that has been common to tiny house models over the past few years. As the tiny house industry has matured, customers are embracing newer home designs and modernized 82157476af
